

Base README Template

This template should be used as a starting point for all Vegan Hacktivists projects.

```
# [PROJECT_NAME](https://example.org)
```

- 1. [Local development setup](#local-development-setup)
- 1. [Custom configuration options](#custom-configuration-options)
- 1. [Scheduled jobs](#scheduled-jobs)
- 1. [Custom commands](#custom-commands)
- 1. [Receiving emails locally](#receiving-emails-locally)

Local development setup

This project uses [Laravel Sail](https://laravel.com/docs/9.x/sail#main-content) for local development.

Docker

First, you must download [Docker](https://www.docker.com/).

PHP

In order to install the dependencies required to set up Laravel Sail, you will need PHP installed locally.

- * For MacOS users, Homebrew is the recommended way of doing this: `Homebrew install php`
- * For Windows users, you may follow [these instructions](https://phptherightway.com/#windows_setup).
- * For Linux users, you should install PHP via your distribution's package manager.

Setup

After you have Docker and PHP installed, navigate to the project directory and run the following:

```
```bash
composer install
./vendor/bin/sail up
./vendor/bin/sail yarn
```
```

Note: If you have `node` and `yarn` installed locally, you can run `yarn` from your local machine instead of within the Docker container if you'd like.

Pro tip! Add the following (or something equivalent) to your shell configuration to use Sail more easily:

```
```bash
alias sail="bash vendor/bin/sail"
```
```

Development

During development, it's recommended to run the following in parallel:

```
```bash
sail up # starts up Docker container
sail yarn dev # watches for JS/CSS changes
```
```

[Custom configuration](https://laravel.com/docs/9.x/structure#the-config-directory)

This project uses the following custom config files:

* [FILE.php](https://github.com/veganhacktivists/REPO/blob/main/config/FILE.php)

[Scheduled jobs](https://laravel.com/docs/9.x/scheduling#main-content)

This project has the following scheduled jobs:

* [JOB_NAME](https://github.com/veganhacktivists/REPO/blob/main/app/Jobs/JOB_NAME.php): This job sends a weekly email to users letting them know about something.

[Custom commands](https://laravel.com/docs/9.x/artisan#writing-commands)

This project has the following commands:

- [COMMAND](https://github.com/veganhacktivists/REPO/blob/main/app/Jobs/COMMAND_NAME.php): This command prints out a list of all users who have this setting set.

Receiving emails locally

In order to check emails sent locally, visit `http://localhost:8025` to access

[MailHog](https://github.com/mailhog/MailHog), which is [provided by Laravel Sail](https://laravel.com/docs/9.x/sail#previewing-emails)
